1 How is your console like the ancient TTY subsystem in Unix as described in <https://www.linusakesson.net/projects/tty/>

My console is like the ancient TTY subsystem in many ways. The first is that our line editing has the similar rudimentary editing commands such as clear line, backspace. Another similarity is that we both have a buffer to display the text and a graphics so that when you type commands on the console it shows what's being typed.
